

## Устойчивость стержня переменного сечения

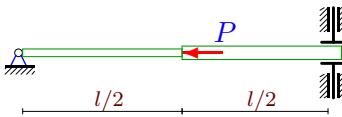

Прямолинейный стержень длиной  $l$ , закрепленный по концам, сжимается одной или двумя продольными силами. Задано соотношение моментов инерции участков стержня. Определить коэффициент  $\mu$  приведения длины стержня в формуле для критической силы  $P_{\text{кр}} = \pi^2 E J / (\mu l)^2$ .
